How are patients informed of their type 2 diabetes diagnosis?

Face-to-face diagnosis varied across the globe

Research from the IntroDia® survey showed that the majority of doctors believe better quality communication at diagnosis is linked to better patient outcomes in the future.

Patients who recalled better communication at diagnosis reported reduced diabetes-related emotional distress and improved diet, exercise and medication adherence.

These findings were taken from the IntroDia® survey, the largest multi-national survey of patient-doctor conversations in type 2 diabetes. 5,904 people with type 2 diabetes from 26 different countries were surveyed about their diagnosis experience specifically.
